Who Gives to Whom? Foreign Gifts, U.S. Bureaucrats, and What Givers and Recipients Share, 1999–2023

Raymond Hicks*

Working paper — October 2026

Abstract

Every year the U.S. Department of State publishes, in the *Federal Register*, a list of the gifts that foreign governments gave to federal employees: who gave what to whom, when, what it was worth, and what happened to it. The list is a rare, systematic, and official record of personal contact between foreign leaders and American officials: it tells us which American bureaucrats foreign governments cultivate, and through whom. As published, however, it is a set of loosely formatted tables that do not link across years or to any other source. We describe a pipeline that turns these releases into a *living dataset*: a collection that is rebuilt from source each time a new report appears, rather than frozen at the moment of a single coding effort. The pipeline downloads each report, parses its free-text fields, recovers the reporting agency, and resolves givers and recipients to Wikidata identifiers. The current release holds 10,428 gifts from 169 countries reported by 107 agency units. We argue that the persistent identifier is the key design choice. It turns a hard fuzzy-matching problem into an exact join with other person-level resources, such as the Comparative Legislators Database. It separates the *office* from the *officeholder*, so the same individual can be followed across careers. And it lets context that the gift reports never contain (later offices, education, party, family ties) be refreshed from Wikidata as those records grow. Using Wikidata statements on gender, birth year, occupation, military service, education, and employment, we profile the officials who receive gifts in each branch of government and ask what they have in common with the foreign officials who give to them. Givers and recipients resemble each other more than random pairings would, but most of that resemblance is institutional: each American office draws a characteristic foreign counterpart, so military officers give to military officers and diplomats to diplomats. Person-level similarity beyond the office is modest. It appears in shared careers and birth cohorts and, in a small number of striking cases, in shared schooling at American universities and military colleges. Classifying officials by career, we find that technocrats, business people, military officers, and leaders' spouses tend to exchange gifts with their own kind. Background also shapes the form of a gift more than its value: business givers favor textiles, military givers ceremonial weapons, and spouses jewelry. We also present descriptive statistics by individual, country, and branch, and outline applications in bureaucratic politics, international relations, and legislative studies.

Keywords: foreign gifts, bureaucrats, homophily, diplomacy, living data, Wikidata, record linkage, political elites

1 INTRODUCTION

Political scientists increasingly study politicians and bureaucrats as individuals: their class backgrounds, careers, networks, and post-office trajectories (e.g., Carnes and Lupu, 2023; Lewis, 2008; Teodoro, 2011). These research programs share a practical bottleneck. Information about any given official is spread across many sources: rosters, appointment records, financial disclosures, travel logs, and news. Each source names people slightly differently and is updated on its own schedule. A researcher who wants to know whether a senator who later became Secretary of State received more foreign gifts in her second job than in her first must reconcile spellings (*Hillary Rodham Clinton*, *Mrs. Clinton*, *Secretary Clinton*), separate the person from the office, and then redo the work when the next year of data arrives.

This paper presents a dataset designed around that bottleneck. Our substantive source is the annual list of *Gifts to Federal Employees From Foreign Government Sources*, compiled by the Department of State's Office of the Chief of Protocol under the Foreign Gifts and Decorations Act (U.S. Code). Each entry records a recipient, a foreign giver, a description of the item, the date it was received, an estimated value, its disposition, and often a justification for accepting it. The records cover heads of state presenting gifts to presidents, defense ministers to combatant commanders, and intelligence services to the Central Intelligence Agency. Read together, they form one of the few official, systematic records of *personal* contact between foreign governments and American officials, broken down by person and by year.

Most of the people in these records are not elected. Ambassadors, assistant secretaries, admirals, generals, and agency heads together receive more gifts than presidents and members of Congress, and each gift names both the American official and the foreign official who presented it. The records therefore let us ask two questions about the bureaucracy that are hard to answer elsewhere. First, *who* are the American officials that foreign governments cultivate, and how do they differ across the diplomatic, defense, intelligence, and domestic agencies? Second, *what do givers and recipients share*? Social ties form disproportionately among similar people (McPherson et al., 2001), personal rapport is a resource in diplomacy (Holmes, 2013), and American universities and military colleges have trained a large share of the world's elites (Atkinson, 2010; Ruby and Gibler, 2010; Gift and Krcmaric, 2017). If foreign governments direct gifts toward officials who resemble their own representatives, by career, generation, or schooling, then the gift record captures relationships that run between people and not only between offices. Answering either question requires knowing much more about givers and recipients than the gift reports contain.

Our contribution is less the gift records themselves, which are public, than the infrastructure that makes them usable and keeps them current. We treat the collection as a *living dataset*: one rebuilt from source each time a new report is published, with every derived variable reproducible from code and every judgment stored in versioned lookup files rather than in a one-off spreadsheet. Its central design choice is to tie each giver and recipient to a Wikidata identifier (QID; Vrandečić and Krötzsch, 2014). That choice does three things at once.

1. **It makes merging cheap.** Many person-level datasets in political science already carry

Wikidata IDs, most prominently the Comparative Legislators Database (CLD; Göbel and Munzert, 2022). A QID turns a probabilistic name-matching exercise (Enamorado et al., 2019) into an exact join.

2. **It separates office from officeholder.** The gift reports record the job a person held when they received a gift. The QID records the person. With both, one can follow an individual through Congress, the White House, the State Department, and the intelligence community, which is the variation that bureaucratic-politics theories often care about.

3. **It makes context updatable.** Wikidata's statements about a person's positions, education, party, and family keep growing after a gift is recorded. A living dataset can re-query those statements at each release, so covariates that a static file would freeze stay current.

The third advantage is what makes the substantive questions above answerable. Through the QIDs, the pipeline attaches roughly 47,700 Wikidata statements to the givers and recipients. We use them to profile the recipients in each branch (Section 6) and to compare each giver with the official who received the gift (Section 7).

The rest of the paper is organized as follows. Section 2 defines living data and why it matters for merging and updating. Section 3 describes the source. Section 4 details the pipeline, and Section 5 presents descriptive statistics for individuals, countries, and branches. Section 6 profiles the officials who receive gifts, Section 7 asks what they share with the officials who give them, and Section 8 compares givers and recipients with technical, business, and political backgrounds. Sections 9–11 develop the three advantages above: linkage, office versus officeholder, and automatic tracking of diplomatic contact. Section 12 sketches applications and the planned interactive application, and Section 13 discusses limitations.

2 WHAT IS A LIVING DATASET?

LIVING DATASET

A **living dataset** is a continuously updating collection of data that evolves over time rather than remaining frozen in a static state. Concretely, (*a*) it is rebuilt from primary sources by code whenever those sources change; (*b*) human judgments (for example, "this *Abdullah* is `Q57464`") are stored as data in versioned lookup tables, so they persist across rebuilds instead of being redone; (*c*) entities are keyed by persistent identifiers maintained outside the project, so linked attributes can be refreshed; and (*d*) each release is reproducible, so a result can be traced to a specific version of sources, lookups, and code.

Most datasets in political science are *static*: a team codes a population over a fixed window, deposits a file, and moves on. Static datasets are valuable and often superb, but they carry two familiar costs.

Static data are hard to merge. A dataset built around names, or around project-specific numeric codes, can be joined to another only through a crosswalk that someone must build. For countries this problem is largely solved by shared code systems and the tools that translate among them (Arel-Bundock et al., 2018). For individuals it is not. Names are transliterated in many ways (the lookup file maps eleven distinct name strings, among them *Abdelazia*, *Abdelkaziz*, and

Bonteflika, to Abdelaziz Bouteflika's single QID), titles are folded into names, and the same person appears under different offices. Researchers therefore fall back on fuzzy or probabilistic record linkage (Enamorado et al., 2019). That is feasible but costly, and every research team repeats it with slightly different results.

Static data are hard to update. When a source adds a year, a static dataset either goes out of date or must be reconstructed, often by different people with different rules. The cleaning decisions embedded in the original release (which rows were dropped, how ambiguous names were resolved) are frequently lost. The transparency and replication literature has long noted this problem (King, 1995; Lupia and Elman, 2014). Event datasets such as GDELT (Leetaru and Schrodt, 2013) show the opposite pole: fully automated and continuously updated, but with limited human verification of who the actors are.

A living dataset sits between these poles. Updating is routine because the pipeline, not a person, does the repetitive work. Human verification is cumulative because it is stored in lookup files the pipeline consults on every run. Merging is cheap because entities are keyed to an external, community-maintained identifier. These features map closely onto the FAIR principles of findability, accessibility, interoperability, and reusability (Wilkinson et al., 2016). The persistent identifier is what makes the data interoperable.

The gift reports suit this model particularly well. They arrive on a predictable annual cycle, roughly a year after the calendar year they cover: the report for calendar year 2024 appeared on January 29, 2026 (Office of the Chief of Protocol, 2026). Their format drifts from year to year, but not by much. And most of their actors are exactly the kind of internationally prominent people Wikidata describes well.

3 THE SOURCE: FOREIGN GIFT REPORTS

The U.S. Constitution's foreign emoluments clause bars federal officers from accepting any "present" from a foreign state without the consent of Congress. The Foreign Gifts and Decorations Act of 1966, codified at 5 U.S.C. § 7342, supplies that consent in a structured form. Employees may accept gifts of "minimal value" (a threshold the General Services Administration revises every three years to track the consumer price index: $390 for 2017–2019, $415 for 2020–2022, and $480 for 2023–2025; General Services Administration 2023). Gifts above the threshold may be accepted when refusing would "cause offense or embarrassment or otherwise adversely affect the foreign relations of the United States," but they become property of the United States and must be reported. Each employing agency compiles these reports, and the State Department publishes the combined list annually. The statute's definition of "foreign government" includes international organizations, so the World Health Organization and NATO bodies appear as givers alongside heads of state. Agencies may also withhold the giver's identity when publishing it would harm intelligence sources (§ 7342(f)(4)). We return to this below.

Each published entry has four fields:

- **Recipient**: name, title, and often the organization ("Admiral John Richardson, U.S. Navy, Chief of Naval Operations");

Table 1. Pipeline stages, scripts, and outputs.

Stage	Script	What it does
1. Acquire	`download_data.py`	Fetches the Federal Register XML for a report year (URLs kept in `files/urls.csv`); archives the XML; writes one raw CSV per year.
2. Parse	`parseandclean_new.py`	Forward-fills recipient and giver across multi-item listings; splits the gift blob into item, receipt date, value, disposition, location; splits names from honorifics, ranks, titles, and organizations; standardizes dates.
3. Resolve	`wikifind.py`, `masterwiki_new.csv`, `groups.csv`, `nowiki2.txt`	Searches Wikidata for unmatched names, has a human verify the candidates, and stores the verified mappings as lookup tables that every later run reuses. Resolves bare offices ("President") to the holder in that year.
4. Enrich	`scripts/wiki_properties.py`	Downloads selected Wikidata statements (positions held with start/end dates, citizenship, education, party, occupation, military rank, employer, family, and so on) for every linked QID. The countries of the educational institutions are looked up once and cached.
5. Analyze	`analysis/build_analysis_data.py`	Recovers the reporting agency from the XML section headings and groups agencies into branches; assigns giver country and giver type; builds person-level edge lists and a balanced country-year panel.
6. Describe	`analysis/descriptives.py` (`.do`)	Produces the tables and figures in this paper and an interactive map.

- **Gift**: a free-text block that packs together the description of the item, the date received, the estimated value, and the disposition ("... Rec'd—August 28, 2002. Est. Value—$1,000,000. Archives Foreign");
- **Giver**: honorific, name, title, and country ("His Royal Highness Prince Bandar bin Sultan, Ambassador of Saudi Arabia");
- **Circumstances**: the justification for acceptance (most often the non-embarrassment clause).

Entries are grouped into agency sections, such as "The White House—Executive Office of the President," "Department of the Navy," and "United States Senate," and the grouping is itself informative. The reports are published as structured XML, which we use, though the content of each cell is free text.

4 THE PIPELINE

Table 1 summarizes the pipeline. Each stage reads the output of the previous one, so a new annual report can be added with one download command and one rebuild.

4.1 ACQUISITION AND PARSING

The reports are published in the *Federal Register* without a dedicated landing page, so each year's XML URL is recorded once in `files/urls.csv`. The download step stores both the original XML and a raw CSV, so later stages can return to the source. Parsing is mostly regular-expression work, but three features of the source deserve mention because they recur in other government registers.

First, multi-item listings name the recipient and giver once and leave later rows blank; forward-filling restores the pair for each item. *Second*, the gift field packs several variables into one string, and the labels drift across years ("Est. Value—," "Estimated Value:," "Appraised Value"). The parser peels labeled fields off the end of the string. Where a disposition appears without a label ("$280. Government Property"), the parser does not try to enumerate the open-ended set of disposition phrases. It instead reads the value expression, whose vocabulary is closed (currency amounts, "each," "approximately," punctuation), and treats whatever follows as the disposition. *Third*, honorifics and ranks ("His Excellency," "The Right Honorable," "Admiral") are split from names before matching, because they otherwise defeat any name lookup.

4.2 ENTITY RESOLUTION TO WIKIDATA

Name resolution is deliberately *semi*-automated. For each name without a QID, a SPARQL query returns Wikidata humans whose label or alias matches. A human then confirms, rejects, or corrects the candidates. Fully automated matching is unsafe: a query for "Qin Gang" returns five people. Confirmed matches are written to a master lookup file (`masterwiki_new.csv`, currently about 4,700 name-to-QID mappings). Names that are confirmed to have no Wikidata item are written to an exclusion list, so they are not searched again. Non-person givers and recipients receive explicit codes: `FAMILY` for joint gifts from a royal couple, `GROUP` for delegations, `UNCLEAR` for unresolvable cases, and `NIL` for statutory placeholders such as "5 U.S.C. 7342(f)(4)." This separates "not yet looked up" from "looked up and not a person," a distinction a living dataset needs.

Recipients recorded only by role ("President," "Vice President," "First Lady") are resolved by year to the person who held the role. This is the first, simplest instance of the office/officeholder distinction we develop in Section 10.

4.3 RECOVERING THE REPORTING AGENCY

The reporting agency is not a field in the parsed data, but the XML encodes it. From 2001 onward each agency's table carries a title (`<TTITLE>Agency: Department of the Navy</TTITLE>`). In 1999 and 2000 the agency appears as a one-cell row inside a single long table. Walking the XML rows in document order assigns every gift to an agency. All 10,428 records receive one, under 107 distinct labels, which we group into seven branches: White House (including the Office of the Vice President and the National Security Council), Diplomatic (State, USAID), Defense (the department, the services, and combatant commands), Intelligence (CIA, ODNI, DIA), Legislative (House, Senate, GAO), Judicial, and Other executive. The agency tells us *which institution* reported the gift; the recipient's QID tells us *who* received it.

Table 2. Overview by five-year period. "Recip./Giver linked" is the share of gifts whose recipient or giver is resolved to a Wikidata QID. Median value excludes gifts of travel and is in nominal dollars.

Period	Gifts	Recipients (QID)	Givers (QID)	Countries	Recip. linked	Giver linked	Median value ($)
1999–2003	2,303	213	529	123	70%	81%	450
2004–2008	2,285	230	617	138	81%	84%	460
2009–2013	2,688	373	845	137	68%	73%	680
2014–2018	2,139	336	677	137	69%	74%	650
2019–2023	1,013	177	332	104	62%	62%	795
All years	10,428	1,026	2,361	169	71%	76%	580

4.4 GIVER COUNTRY AND GIVER TYPE

We assign each gift a giving country from the text of the giver field, which almost always names the government ("... King of the Kingdom of Saudi Arabia"). Where the text names no country, we fall back on the giver's Wikidata country of citizenship (P27). Regime-specific Wikidata items ("Islamic Republic of Afghanistan," "Great Socialist People's Libyan Arab Jamahiriya") are folded into the continuing state, so each country keeps a single identifier and ISO 3166 code across the panel. This yields a country for 84% of gifts. Nearly all of the rest are gifts with a withheld giver identity or gifts from international organizations, which we code as their own giver type. As a check, where both sources are available (more than 5,000 gifts), the text-based country and the Wikidata citizenship agree 99% of the time. We also classify the giver's role from honorifics and titles: royalty, head of state or government, minister, military officer, diplomat, legislator, intelligence or security official, or international organization.

4.5 THE ANNUAL UPDATE CYCLE

Adding a year requires (*i*) recording the new XML URL, (*ii*) running the download and parse scripts, (*iii*) reviewing only the names that are new to the lookup files, and (*iv*) re-running enrichment and analysis. Step (*iii*) is the only manual one, and its cost falls over time. Heads of state, ministers, and senior American officials recur year after year, so each annual report adds proportionally fewer unmatched names. Table 2 shows the flip side: the newest period, 2019–2023, has the lowest linkage rate because its names have had the least review. In a living dataset, linkage rates are a release-specific quantity that should rise over time. In a static file, they are a permanent property of the data.

5 DESCRIPTIVE OVERVIEW

The current release contains 10,428 gifts reported between 1999 and 2023 (Table 2). It covers 1,026 distinct recipients and 2,361 distinct givers with Wikidata identifiers, and givers from 169 countries. Seventy-one percent of gifts have a resolved recipient and 76% a resolved giver. Ninety-four percent have a parseable dollar value; the median non-travel gift is worth about $580, and the largest single item is a $1,000,000 C. M. Russell painting presented by Saudi Arabia's ambassador to the First Family in 2002. About 11% are gifts of travel or lodging, concentrated in Congress and the smaller executive agencies.

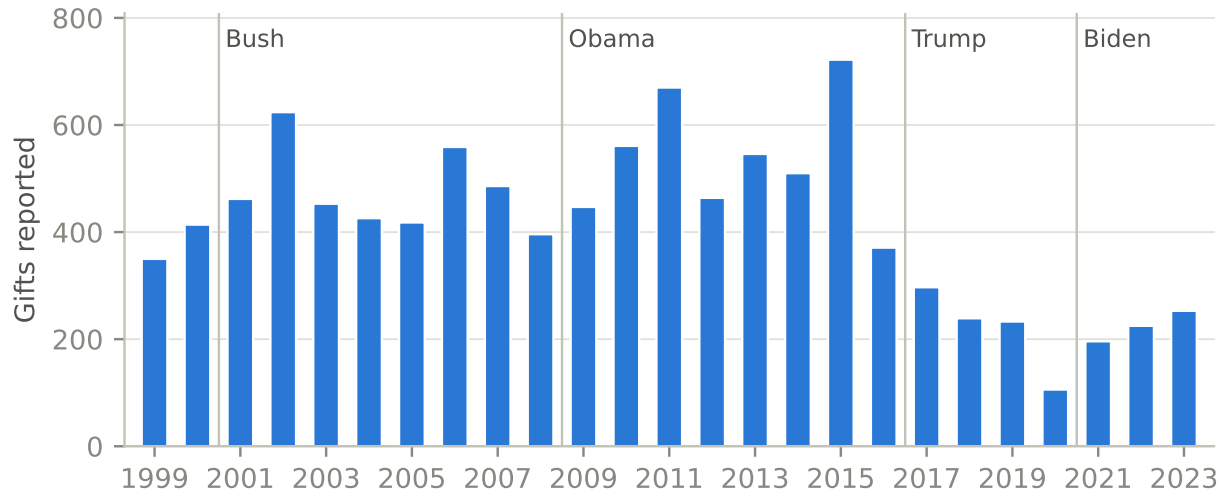

Figure 1. Gifts reported per year (report year), 1999–2023. Vertical rules mark presidential transitions.

Table 3. Gifts by branch of the reporting agency. "Confidential giver" is the share of gifts where the giver is withheld under 5 U.S.C. § 7342(f)(4). "Travel" is the share that are gifts of travel or lodging.

Branch	Gifts	Share	Agencies	Recip. linked	Giver linked	Confidential giver	Travel
White House	3,827	37%	16	84%	91%	0%	0%
Diplomatic	1,655	16%	9	76%	84%	0%	2%
Defense	1,890	18%	15	69%	69%	0%	3%
Legislative	1,115	11%	7	73%	90%	0%	41%
Intelligence	947	9%	4	35%	1%	99%	2%
Other executive	952	9%	55	46%	75%	0%	57%
Judicial	42	0%	1	83%	81%	0%	71%

Figure 1 shows the volume of reported gifts over time. Reports rose through the Obama administration, peaking at 722 in 2015, and then fell sharply: 4,291 gifts were reported for 2009–2016 against 1,549 for 2017–2023, with a low of 106 in 2020. The pandemic explains part of the 2020 trough. The 2017–2019 decline, however, began before the pandemic, and whether it reflects fewer gifts, less reporting, or changes in compilation is an open question that the data invite rather than answer. A 2024 Inspector General report found weak controls over foreign gifts (GSA Office of Inspector General, 2024). The figure also contains a measurement lesson: the 2015 spike is partly a backlog. The 2015 Senate report includes 243 gifts received years earlier, by members such as Joe Biden and Hillary Clinton while they were still senators. We therefore keep both the *report year* and the *receipt year* (available from the gift's date for 92% of records). In about 5% of records the two differ by more than a year.

5.1 RECIPIENTS BY BRANCH

The branch of the reporting agency structures almost everything about a gift (Table 3, Figure 2). The White House accounts for 37% of gifts. These are the gifts of summit diplomacy, given overwhelmingly by heads of state and royalty and almost all resolvable to named people. Defense (18%) and Diplomatic (16%) agencies follow. Defense gifts flow largely from foreign military officers

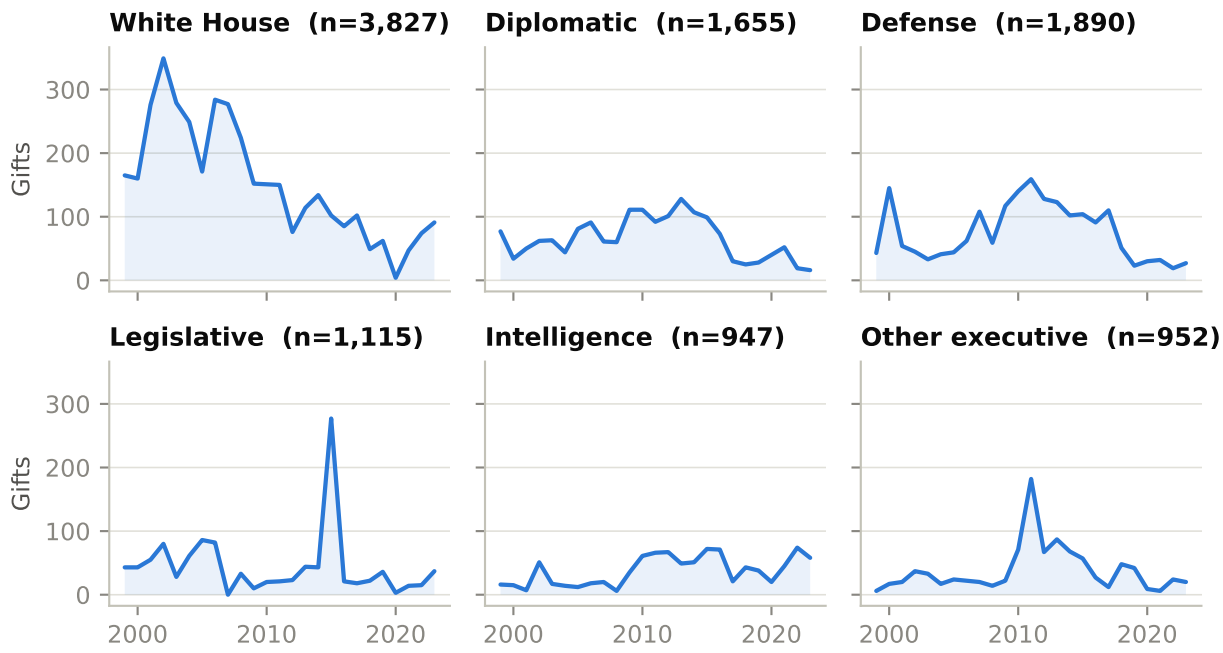

Figure 2. Gifts per year by branch of the reporting agency (report year). Panels share a y-axis. The Judicial branch (42 gifts) is omitted.

to American commanders, and their volume tracks the wars in Iraq and Afghanistan, peaking around 2011. Congress (11%) is distinctive in that 41% of its reported gifts are travel, which reflects congressional delegations. The intelligence community (9%) is almost entirely opaque: 99% of its gifts list the giver only as "5 U.S.C. 7342(f)(4)," and only 35% of its recipients are named. This is a substantive feature, not a parsing failure, and analysts should treat intelligence gifts as an *institution-level* rather than a person-level record.

5.2 GIVERS AND RECIPIENTS BY LEVEL

Figure 3 cross-tabulates the level of the giver against the branch of the recipient. The diagonal structure is striking: foreign governments match the rank and function of their counterpart. Heads of state and government account for 40% of gifts to the White House, and royalty for another 18%. Military officers account for 44% of gifts to Defense. Ministers are spread across the White House, State, and Defense, consistent with their role as counterparts to cabinet secretaries. Foreign legislators are a small share of givers even to Congress. Most gifts to Congress come from heads of government, ministers, and unspecified officials, many of them hosting congressional delegations abroad. The pattern suggests that the gift record captures *protocol-matched* contact: each tier of the U.S. government has a characteristic foreign counterpart. This is the kind of relationship that a network view of the data (Section 12) makes visible.

5.3 INDIVIDUALS

Tables 4 and 5 list the most frequent recipients and givers. Presidents and their spouses dominate the recipient list; George W. Bush alone received 888 reported gifts. Secretaries of State come

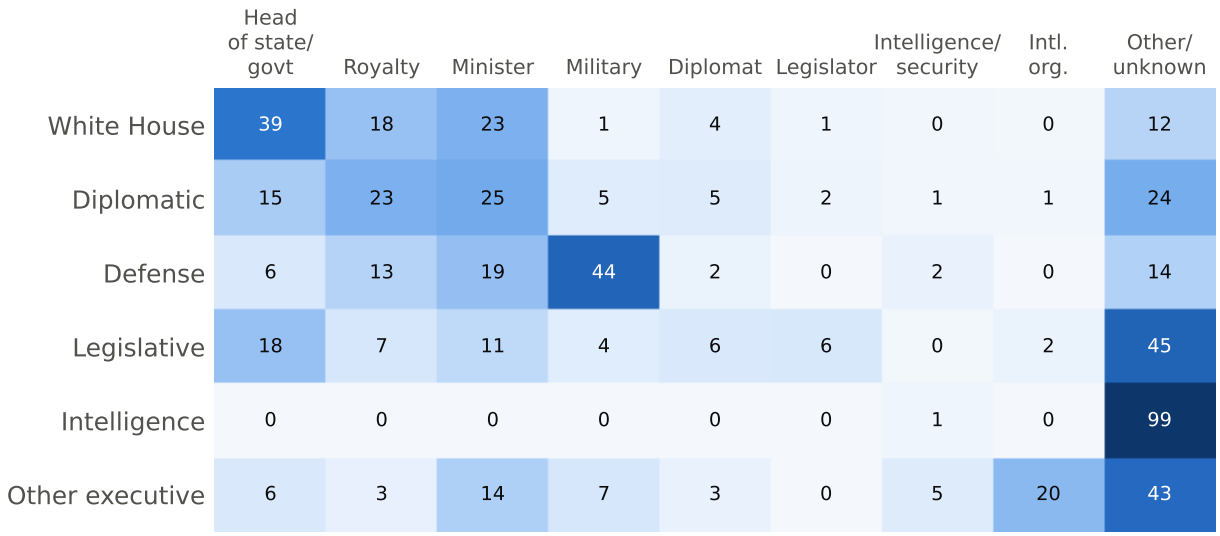

Figure 3. Who gives to whom. Cells show the percentage of each recipient branch's gifts that come from each type of giver (rows sum to 100). Giver type is coded from honorifics and titles.

next. The giver list is a roster of long-serving leaders, above all Gulf and Middle Eastern monarchs: Abdullah II of Jordan (210 gifts, 2000–2023), King Abdullah of Saudi Arabia, Hamid Karzai, and Qatar's Hamad bin Ali Al Attiyah. Long tenure means many opportunities to give. The values are highly skewed. King Abdullah's 188 gifts total $5.9 million, much of it in jewelry sets presented to first ladies, cabinet officials, and their spouses, while Brunei's sultan gave 96 gifts worth about $120,000 in total.

5.4 COUNTRIES

Table 6 and Figure 4 aggregate gifts to the country level. Saudi Arabia (477 gifts, $8.6 million), Qatar, Afghanistan, Jordan, China, and the United Arab Emirates lead. Gulf states are heavily overrepresented relative to their population or economic size, consistent with a gift-giving diplomatic culture and close security ties. The heatmap shows that country-level gift flows carry the imprint of events: Afghanistan and Iraq rise and fall with U.S. deployments, Qatar's gifts climb through the 2010s as Al Udeid became the hub of U.S. air operations, and Russia's are concentrated in the early 2000s and nearly vanish after 2016. Only Saudi Arabia, Jordan, China, the UAE, Pakistan, Bahrain, and South Korea give in every one of the 25 years.

6 WHO RECEIVES FOREIGN GIFTS?

The QIDs turn the gift record into a roster of the officials whom foreign governments cultivate. Table 7 describes the 1,026 linked recipients using Wikidata statements (coverage is reported in Table 14). The branches draw on distinct populations. Seventy-four percent of Defense recipients have a military career, and only 12% are women. Seventy-one percent of Diplomatic recipients are recorded as diplomats, and 32% are women, the highest share outside the White House. Legislative recipients are older (median birth year 1951), and 42% are lawyers, as one would expect of members

Table 4. Top recipients by number of gifts (Wikidata-linked). Value is the nominal sum of estimated values. Branch lists every branch under which the person received gifts.

Name	Branch	Wikidata	Gifts	Years	Value ($)
George W. Bush	White House	Q207	888	2001–2008	1,107,429
Barack Obama	White House, Legislative	Q76	482	2005–2016	2,031,573
Laura Bush	White House	Q152019	445	2001–2008	470,173
Hillary Clinton	White House, Diplomatic, Legislative	Q6294	298	1999–2015	1,278,972
Condoleezza Rice	White House, Diplomatic	Q47216	246	2001–2008	1,265,892
Joe Biden	White House, Legislative	Q6279	229	2000–2023	554,104
John Kerry	Diplomatic, Legislative	Q22316	165	2001–2023	338,428
Michelle Obama	White House	Q13133	154	2009–2016	1,847,616
Bill Clinton	White House, Diplomatic	Q1124	151	1999–2010	222,532
Colin Powell	Diplomatic	Q150851	150	2001–2016	183,094
Dick Cheney	White House	Q48259	101	2004–2008	210,735
Donald Rumsfeld	Defense	Q184650	88	2001–2006	151,621
John Owen Brennan	White House, Intelligence	Q984191	83	2009–2016	133,782
Donald Trump	White House	Q22686	82	2017–2019	230,192
Robert Gates	Defense	Q212979	79	2006–2011	64,040

Table 5. Top givers by number of gifts (Wikidata-linked).

Name	Country	Wikidata	Gifts	Years	Value ($)
Abdullah II of Jordan	Jordan	Q57464	210	2000–2023	332,229
Abdullah of Saudi Arabia	Saudi Arabia	Q57298	188	2000–2018	5,903,000
Hamid Karzai	Afghanistan	Q43944	160	2002–2020	276,648
Hamad bin Ali Al Attiyah	Qatar	Q21004768	129	2001–2018	380,328
Silvio Berlusconi	Italy	Q11860	124	2001–2015	404,420
Hassanal Bolkiah I of Brunei	Brunei	Q57327	96	1999–2023	118,589
Mohammed VI of Morocco	Morocco	Q57553	69	1999–2016	291,119
Mohamed Hussein Tantawi	Egypt	Q45917	64	1999–2011	40,210
Salman bin Hamad, Crown Prince of Bahrain	Bahrain	Q58140	63	2000–2023	140,156
Ali Bin Fetais Al-Marri	Qatar	Q55081149	61	2006–2019	190,397

Pervez Musharraf	Pakistan	Q40495	50	2000–2015	33,572
Abd al-Aziz Boutafliqa	Algeria	Q57308	50	2000–2016	41,882
Islam Karimov	Uzbekistan	Q57558	46	1999–2015	29,754
World Health Organization	(intl. org.)	Q7817	45	2007–2019	103,219

of Congress. The White House group is the youngest (median birth year 1961) and the most often female, because it includes first ladies, presidential children, and National Security Council staff.

Two columns speak directly to the study of bureaucracy. Party membership, recorded for 87% of legislators, is recorded for only 30% of Diplomatic and 17% of Defense recipients. Absence of a party statement is not proof of a career appointment, but the gradient is consistent with the distinction between political appointees and career officials (Lewis, 2008). The share who studied outside the United States is also low and varies by branch: 17% at State and 7% in Defense. As a result, a foreign official who wants a counterpart with shared educational experience will usually find one only by having studied in the United States. We return to this point below.

These profiles describe the *linked* recipients, who are more prominent than the officials whose names could not be resolved. Assistant secretaries, deputy chiefs of mission, and colonels are less likely to have Wikidata items than secretaries and four-star officers, so the table is a portrait of

Table 6. Top giving countries. "Active years" is the number of report years (of 25) with at least one gift. "Main recipient branch" is the modal branch.

Country	ISO3	Gifts	Active years	Recipients	Value ($)	Main recipient branch
Saudi Arabia	SAU	477	25	131	8,554,042	White House
Qatar	QAT	438	24	124	1,343,133	Defense
Afghanistan	AFG	383	22	122	539,854	Defense
Jordan	JOR	337	25	88	430,180	White House
China	CHN	293	25	105	334,720	White House
United Arab Emirates	ARE	278	25	93	583,853	Defense
Pakistan	PAK	254	25	105	213,268	Legislative

Brunei	BRN	140	19	32	422,239	White House
Mexico	MEX	136	21	47	103,790	White House

the upper bureaucracy. Because the profile is rebuilt from the claims at each release, it will extend down the hierarchy as more officials are linked and as Wikidata adds items for them.

7 WHAT DO GIVERS AND RECIPIENTS SHARE?

Because both parties to a gift carry QIDs, every gift is also a *dyad* of two people whose characteristics can be compared. We compare each giver with the recipient on seven characteristics: gender, professional career, military service, birth cohort, the country and the specific institution where each was educated, and employer. Similarity alone is not evidence of anything, since the people who meet American officials are not a random draw from the world's elites. We therefore compare the observed rate of similarity with two random-pairing baselines (Table 8 and Figure 5). The first shuffles givers among all gifts reported in the same year, which preserves the overall mix of givers and recipients. The second shuffles givers only within the same branch *and* year, which also preserves the kind of foreign official each branch receives. The gap between the observed rate and the first baseline measures the total excess similarity. The gap between the observed rate and the second measures how much of it remains once the office is held fixed. That remainder is the part attributable to the sorting of *people*.

Most similarity is institutional. Givers and recipients share a professional career in 51.6% of gifts, against 36.8% under random pairing within the year. But pairing at random within branch and year already yields 48.7%, so about four-fifths of the excess comes from the office. The same holds for military service: 13.6% of gifts pass between two people with military careers, against 9.2% at random and 13.0% within branch. In Figure 5, this appears as the wide gap between the diamonds

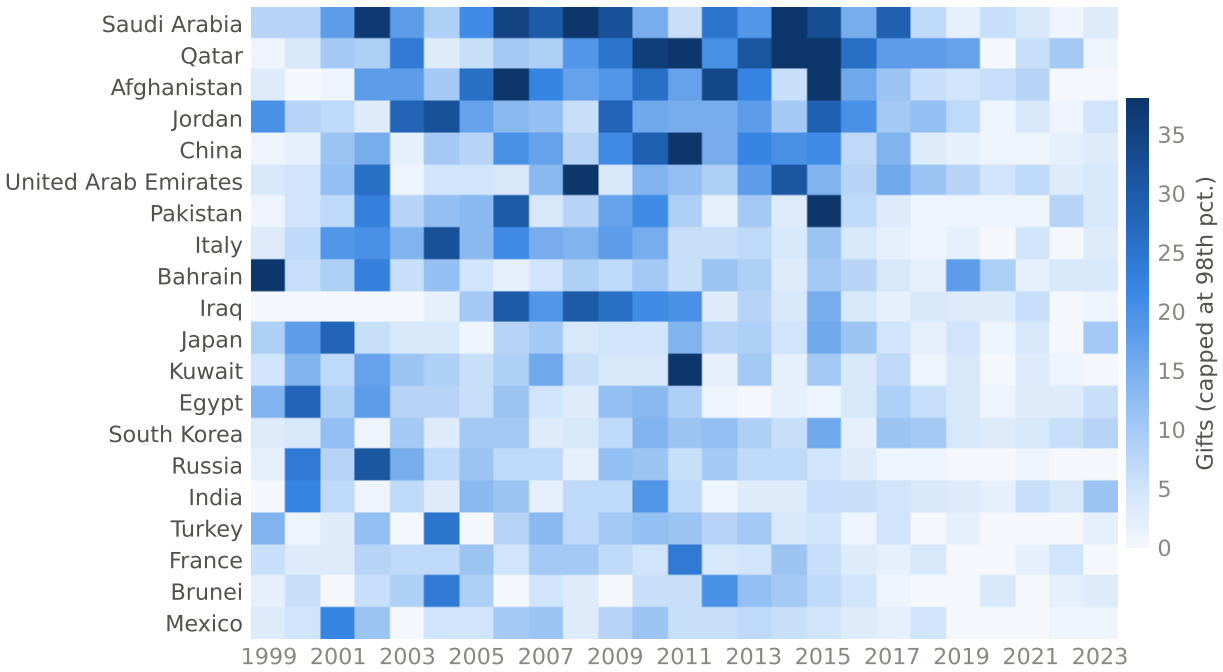

Figure 4. Gifts per year from the twenty most frequent giving countries. Darker cells mean more gifts. The scale is capped at the 98th percentile so a few extreme cells do not wash out the rest.

and the circles for career and military service. This is the protocol matching of Section 5 (Figure 3) seen at the level of individuals. A foreign general gives to an American admiral because the admiral holds the office that receives foreign generals, not because of any personal affinity between the two.

Person-level similarity is real but modest. Even against the branch-year baseline, observed similarity in gender, career, military service, and birth cohort is higher, by ratios of 1.02 to 1.08, and in all but one case fewer than 1% of permutations match it. In the executive agencies (Panel B), the excess is clearest for professional careers (62.3% against 57.4%) and for birth cohort (35.1% against 32.9%). Within the same office and year, foreign officials are slightly more likely to give to an American of the same profession and generation. Gender is a partial exception. Across all branches, same-gender pairs exceed the branch-year baseline by about five points, but in the executive agencies the excess is only one point. Gender matching is concentrated in the White House: 162 of the 233 woman-to-woman gifts went to White House recipients, most of them to first ladies and many from the spouses of foreign leaders.

Shared schooling is rare but striking. Givers and recipients attended the same institution in fewer than 1% of gifts. That share is still 1.65 times the branch-year baseline in the executive agencies ($p = 0.01$). The cases are concentrated in elite American schools and in military education. Admiral Gary Roughead, Chief of Naval Operations, received four gifts in 2009–2011 from a Saudi naval officer, Prince Fahd bin Abdullah bin Mohammed Al Saud, who, like Roughead, attended the U.S. Naval Academy. Colin Powell (2001) and Joseph Ralston (1999) received gifts from foreign

Table 7. Wikidata-linked recipients by branch of the reporting agency. A person who received gifts under several branches is counted in each. "Female" is the share of people with a recorded gender. "Military" means a recorded military rank (P410) or military occupation (P106). "Diplomat" and "Law" are occupation groups. "Party member" means any recorded party membership (P102). "Studied abroad" is the share of people with at least one school of known country who attended a school outside the United States. Missing statements count as absent, so shares other than "Female" and "Studied abroad" are lower bounds.

Branch	People	Female	Born (median)	Military	Diplomat	Law	Party member	Studied abroad
White House	135	35%	1961	10%	31%	29%	65%	21%
Diplomatic	223	32%	1954	5%	71%	11%	30%	17%
Defense	252	12%	1956	74%	6%	4%	17%	7%
Legislative	278	17%	1951	13%	6%	42%	87%	9%
Intelligence	19	11%	1953	47%	11%	16%	47%	11%
Other executive	155	19%	1952	7%	3%	20%	41%	15%
Judicial	19	21%	1948	0%	0%	95%	11%	22%
All	1,026	21%	1954	25%	21%	22%	46%	12%

officers who had attended the Army Command and General Staff College: Bahrain's Hamad bin Isa Al Khalifa and Georgia's David Tevzadze. Ambassador David Hale and King Abdullah II of Jordan are both graduates of Georgetown's School of Foreign Service. The giver side shows the size of this pool. Of the 1,526 linked givers whose schools are recorded, 288 (19%) studied at an American institution, and they account for 22% of gifts from givers with recorded schools. Twenty-seven attended an American service academy or staff or war college, among them Bahrain's Hamad bin Isa Al Khalifa, Egypt's Abdel Fattah el-Sisi, Rwanda's Paul Kagame, and Indonesia's Susilo Bambang Yudhoyono. Such alumni are the people that research on educational exchange and professional military education expects to carry American ties into foreign governments (Atkinson, 2010; Ruby and Gibler, 2010; Gift and Krcmaric, 2017). The gift record shows some of them maintaining those ties with specific American counterparts.

Caveats. The unit is the gift, so a pair that exchanges many gifts weighs more than a pair that exchanges one. Gifts are not independent, so the permutation p-values are descriptive. All seven comparisons depend on what Wikidata records. Coverage of education and employment is thinner for givers from some regions, and missing statements bias every match rate downward. This is also where the living design matters: the rates in Table 8 are recomputed from the claims at each release, so they will sharpen as Wikidata's coverage of foreign officials grows. The design extends naturally to richer measures of similarity, such as overlapping assignments, common postings, or shared membership in international bodies, all of which can be read from dated Wikidata positions.

8 TECHNICAL, BUSINESS, AND POLITICAL BACKGROUNDS

The officials on both sides of a gift arrive in office by different routes. Some are career politicians. Others are technocrats, such as economists, central bankers, civil servants, and officials of international organizations, and others come from the private sector. The background of an officeholder shapes policy (Adolph, 2013; Alexiadou, 2016; Hallerberg and Wehner, 2020), and it may also shape whom an official deals with and how. This section classifies givers and recipients by background

Table 8. Characteristics shared by the giver and the recipient of each gift, compared with random pairings. The unit is a gift whose giver and recipient both have QIDs. "Gifts" counts those for which the characteristic is recorded for both people. The two baselines shuffle givers among gifts reported in the same year, or in the same branch and year, and average 500 permutations. "Ratio" is observed over the branch-year baseline. p is the share of branch-year permutations at least as large as the observed value. "Professional career" groups occupations into military, diplomat, law, economics/business, academic, and civil servant ("politician" is excluded). Panel B drops gifts reported by the White House and Congress.

			Random pairing (%)			
Shared characteristic	Gifts	Observed (%)	Same year	Same branch-year	Ratio	p
A. All branches (6,195 gifts with both parties linked)						
Same gender	4,513	76.3	70.0	71.1	1.07	<0.01
Same professional career	2,459	51.6	36.8	48.7	1.06	<0.01
Both have military careers	4,521	13.6	9.2	13.0	1.05	<0.01
Same birth cohort (±5 years)	4,262	30.0	28.2	28.6	1.05	<0.01
Educated in the same country	3,599	22.6	22.4	22.7	1.00	0.56
Same educational institution	3,627	0.8	0.8	0.7	1.14	0.20
Same employer	559	1.8	1.0	1.4	1.28	0.12
B. Executive agencies only (2,486 gifts with both parties linked)						
Same gender	2,254	74.8	72.3	73.6	1.02	<0.01
Same professional career	1,307	62.3	41.1	57.4	1.08	<0.01
Both have military careers	2,261	23.7	16.9	23.1	1.03	0.02
Same birth cohort (±5 years)	2,056	35.1	31.4	32.9	1.07	<0.01
Educated in the same country	1,678	21.2	21.4	21.3	0.99	0.65
Same educational institution	1,695	0.9	0.7	0.6	1.65	<0.01
Same employer	191	1.6	0.5	0.5	3.07	0.06

and by the office they held when the gift was exchanged, then asks whether technocrats, business people, and politicians exchange gifts with different counterparts and exchange different gifts.

Coding background and office. We classify each person by the kind of work that fills most of their recorded career. From the dated positions (P39) and employers (P108) in Wikidata, we count the calendar years each person spent in four kinds of work:

- *Political:* elected office, heads of state and government, cabinet posts, and royalty.
- *Technical:* central banks, finance ministries, international organizations, sub-cabinet and diplomatic posts, the judiciary, and employment by a government agency, university, or research institute.
- *Business:* employment by a firm, or posts such as chief executive.
- *Military:* commands and ranks.

Overlapping jobs are counted once, an undated job counts as four years, and a general or flag rank counts as a full military career. The primary background is the kind of work with the most years. Under this rule, a lawyer who spent most of a career in elected office is political (Barack Obama, Joe Biden, Mike Pompeo). A politician whose career was mainly in business is business (Donald Trump, Silvio Berlusconi, Rex Tillerson, Steven Mnuchin), and a central banker or international civil servant who entered politics is technical (Mario Draghi, Ban Ki-moon). Spouses and children

Figure 5. Giver–recipient similarity relative to random pairing (the ratios in Table 8). Diamonds compare the observed rate with random pairing within the same year; circles compare it with random pairing within the same branch and year. The distance between them is the part of the similarity explained by the office. Gray bars show the middle 95% of the 500 branch-year permutations, so a circle outside its bar is unlikely to arise by chance. For a shared employer in the executive agencies, the bar extends below the axis because many permutations produce no matches.

of leaders form a separate category, because they receive and give gifts through family rather than career. People with no classifiable job fall back on occupation and education codes. Table 9 also reports three overlapping indicators, which flag any technical occupation, education, or position, any business occupation, and any political career.

The office is coded at the time of the gift. For recipients it follows the reporting agency: the White House and Congress are political offices, State and USAID diplomatic, Defense, the intelligence community, and Homeland Security security offices, and the remaining executive agencies and the courts technical. For givers it follows the title in the gift report. Finance ministers, central bankers, directors-general, commissioners, and officials of international organizations hold technical offices. Executives of firms hold business offices. Heads of state, ministers, and legislators hold political offices, and officers and diplomats hold security and diplomatic offices.

Who has which background. The recipient and giver populations differ (Table 9). A third of linked American recipients are technocrats by career, about the same share as politicians, and a fifth are military officers. Foreign givers are much more often politicians (48%), reflecting the heads of state, ministers, and legislators who dominate summit diplomacy, and only 11% are technocrats. Business careers are rare on both sides: 4% of recipients and 2% of givers.

Table 9. Backgrounds of Wikidata-linked recipients and givers. The indicators overlap; the primary background is the kind of work that fills most of a person's recorded career (see text). "Unknown" means Wikidata records no classifiable job or occupation.

		Recipients (N=1,026)	Givers (N=2,361)
Indicators (overlap)	Any technical	41%	29%
	Any business	11%	7%
	Any political	50%	65%
Primary background	Political	30%	48%
	Technical	33%	11%
	Business	4%	2%
	Military	19%	13%
	Spouse/family	3%	6%
	Unknown	11%	19%

Table 10. Who gives to whom, by primary background. Gifts whose giver and recipient both have a known background. Each cell shows the percentage of the row's gifts going to each recipient background, with the ratio to the share expected if givers and recipients were matched independently in parentheses. Ratios above 1 mean more gifts than expected.

Giver ↓ / Recipient →	Political	Technical	Business	Military	Spouse/family	Gifts
Political	48 (1.1)	21 (1.0)	7 (1.0)	12 (0.8)	12 (0.9)	2,964
Technical	42 (1.0)	27 (1.2)	9 (1.3)	10 (0.7)	12 (0.9)	420
Business	44 (1.0)	31 (1.4)	12 (1.7)	7 (0.4)	7 (0.5)	138
Military	23 (0.5)	24 (1.1)	6 (0.8)	44 (2.7)	4 (0.3)	631
Spouse/family	16 (0.4)	7 (0.3)	7 (1.0)	1 (0.0)	69 (5.4)	167

Table 11. Who gives to whom, by office at the time of the gift. All gifts with a classifiable giver office. Cells as in Table 10.

Giver ↓ / Recipient →	Political	Technical	Diplomatic	Security	Gifts
Political	65 (1.2)	3 (0.4)	19 (1.1)	13 (0.6)	5,469
Technical	25 (0.5)	38 (5.8)	14 (0.8)	22 (1.0)	841
Business	23 (0.4)	31 (4.7)	40 (2.3)	6 (0.2)	35
Diplomatic	60 (1.1)	5 (0.8)	23 (1.3)	12 (0.5)	361
Security	7 (0.1)	1 (0.2)	5 (0.3)	87 (3.8)	954

Who exchanges gifts with whom. Gifts pass between like backgrounds more often than independent matching would predict (Table 10). The pattern is strongest for spouses and family, who give to their American counterparts at 5.4 times the expected rate, and for military officers (2.7). It is weaker but present for business (1.7) and technical (1.2) careers. Givers with business careers are also overrepresented among gifts to American technocrats (1.4) and underrepresented among gifts to military officers (0.4). Political givers spread their gifts across recipient types almost in proportion. Sorting by office is far sharper than sorting by background (Table 11). Foreign officials in technical offices direct 38% of their gifts to American technical agencies, 5.8 times the expected share, whereas political officeholders direct only 3% of theirs there. Security offices give 87% of their gifts to American security agencies. The few givers in business offices give mostly to technical agencies and to the State Department. As in Section 7, the office does most of the sorting. Background adds a weaker, person-level layer on top of it.

Table 12. The nature and value of gifts by the background of the giver and of the recipient. Median value and the share over $5,000 exclude travel. Gift types are coded from the item description by keyword; the remaining 12% of gifts (pens, desk sets, and miscellany) are not shown.

Background	Gifts	Median ($)	>$5k	Jewelry	Watch	Art, decor	Textile	Weapon	Book	Food	Travel
Giver: Political	4,688	570	7%	13%	7%	49%	4%	8%	3%	2%	1%
Giver: Technical	588	500	4%	10%	5%	51%	5%	9%	3%	2%	3%
Giver: Business	222	728	10%	13%	8%	32%	19%	4%	1%	1%	4%
Giver: Military	825	525	2%	15%	4%	41%	5%	16%	3%	1%	4%
Giver: Spouse/family	387	495	3%	26%	0%	43%	12%	2%	6%	2%	0%
Recipient: Political	2,254	566	6%	7%	3%	52%	3%	9%	2%	3%	8%
Recipient: Technical	1,525	540	5%	14%	4%	43%	4%	10%	2%	1%	9%
Recipient: Business	348	635	5%	11%	1%	55%	3%	12%	1%	1%	3%
Recipient: Military	1,087	632	5%	14%	14%	38%	2%	17%	1%	1%	3%
Recipient: Spouse/family	640	605	8%	31%	0%	45%	10%	3%	1%	1%	2%

Table 13. Log estimated value of a gift regressed on giver and recipient backgrounds and giver office, with branch and year fixed effects. Gifts with both parties linked and a known background, excluding travel. The reference category is political for each set of indicators. Standard errors are clustered by giver. "Value ratio" is $\exp(\beta)$, the multiplicative difference in value relative to the reference.

Term	Coefficient	Std. error	Value ratio
Giver background: Technical	-0.05	(0.10)	0.95
Giver background: Business	0.18	(0.19)	1.20
Giver background: Military	-0.45	(0.20)	0.64
Giver background: Spouse/family	-0.10	(0.14)	0.91
Recipient background: Technical	-0.12	(0.10)	0.89
Recipient background: Business	0.11	(0.08)	1.11
Recipient background: Military	0.16	(0.10)	1.18
Recipient background: Spouse/family	-0.01	(0.11)	0.99
Giver office: Technical	0.01	(0.14)	1.01
Giver office: Diplomatic	-0.37	(0.10)	0.69
Giver office: Security	0.21	(0.16)	1.24
Giver office: Unknown	-0.27	(0.15)	0.77

The nature and value of gifts. What is given differs more by background than how much (Tables 12 and 13). Givers with business careers give the most valuable gifts at the median ($728) and most often give gifts worth more than $5,000 (10%), and they give textiles and clothing far more often than other givers (19%). Military givers favor weapons and ceremonial items such as swords, daggers, and medals (16%). Spouses and family give jewelry (26%) and receive it (31%). Watches go disproportionately to American military officers (14% of their gifts). Once the branch and year are held fixed, however, most differences in value are small and imprecise. Gifts from business givers are about 20% more valuable than gifts from political givers, but the estimate is not distinguishable from zero. Gifts from military givers are about a third less valuable, and gifts from foreign diplomats about 30% less valuable, than gifts from political officeholders. The recipient's background makes little difference to value once the branch is known. Foreign governments appear to scale the value of a gift to the office and the occasion, and to tailor its form to the person.

Caveats. Business careers are rare, so the business estimates rest on a few hundred gifts. The classification depends on Wikidata's dated positions and employers. These are fuller for prominent

Table 14. Share of Wikidata-linked recipients and givers for whom Wikidata supplies each attribute (from a snapshot of statements for all linked QIDs).

Attribute (property)	Recipients (N=1,026)	Givers (N=2,361)
Gender (P21)	98%	84%
Date of birth (P569)	85%	80%
Citizenship (P27)	82%	80%
Occupation (P106)	91%	81%
Position held (P39)	59%	71%
Educated at (P69)	88%	65%
Party membership (P102)	46%	52%
Employer (P108)	31%	15%
Military rank (P410)	21%	15%
Spouse (P26)	14%	30%
Child (P40)	7%	19%
Father (P22)	11%	19%

people and for Western countries, and a fifth of givers have no classifiable career. The office codes for givers rely on titles in the gift reports, and a quarter of giver offices cannot be classified. Gift types are coded by keyword. All of these codes are stored in the analysis script, and the classification is recomputed at each release, so it will improve as Wikidata records more of each official's career.

9 THE WIKIDATA IDENTIFIER AS A LINKING KEY

A QID is a join key and a gateway at once. As a gateway, it connects each gift to whatever Wikidata knows about the people involved. Table 14 shows that, for linked recipients, Wikidata supplies gender for 98%, occupation for 91%, education for 88%, date of birth for 85%, and at least one dated position for 59%. Coverage of givers is similar. Collecting these covariates by hand for 3,400 people in some 170 countries would be a project in itself. Through the QID they arrive with one batched API call per 50 people.

9.1 JOINING TO THE COMPARATIVE LEGISLATORS DATABASE

The Comparative Legislators Database (Göbel and Munzert, 2022) assembles individual-level data on more than 67,000 legislators in 16 countries and keys every legislator to both a Wikipedia page ID and a Wikidata ID. Because the CLD and our data share that key, linking them is an exact join. Table 15 shows the scale of the overlap. Two hundred forty-seven of our recipients served in the U.S. House or Senate at some point, and they account for 2,314 gifts, including gifts received *after* leaving Congress, as Secretaries of State, Vice Presidents, or CIA directors. On the giver side, 179 foreign officials sat in a CLD chamber, led by members of the Italian Chamber of Deputies (22 people, 164 gifts), the Japanese House of Representatives (31 people, 92 gifts), and the French National Assembly. Once joined, a researcher has, for each legislator-recipient, the CLD's political histories, committee and office records, and Wikipedia traffic, alongside the gifts that person received. With the CLD's R interface (Göbel and Munzert), the join takes a few lines:

Listing 1. Joining gift recipients to the CLD (R).

Table 15. Recipients and givers who ever held a seat in a chamber covered by the Comparative Legislators Database, identified from Wikidata positions held (P39). These people can be joined to the CLD on `wikidataid` with no name matching.

Legislature	Recipients	Gifts received	Givers	Gifts given
Italy	0	0	22	164
Japan	0	0	31	92
France	0	0	16	79
Turkey	0	0	16	72
Canada	0	0	15	55
Ireland	0	0	7	52
Germany	0	0	13	46
Israel	0	0	14	46
United Kingdom	0	0	12	32
Czech Republic	0	0	11	24
Spain	0	0	9	15
Austria	0	0	8	11
Netherlands	0	0	5	10
United States	247	2,314	0	0

```
library(legislatoR); library(dplyr)
gifts  <- read.csv("analysis/output/gifts_analysis.csv")
house  <- get_core(legislature = "usa_house")      # one row per legislator
senate <- get_core(legislature = "usa_senate")
congress <- bind_rows(house, senate) |> distinct(wikidataid, .keep_all = TRUE)

linked <- gifts |>
  inner_join(congress, by = c("recip_wiki" = "wikidataid"))   # exact key, no fuzzy match
```

The same logic extends beyond the CLD. Any dataset that carries QIDs, or that can be crosswalked to them once, becomes joinable. For leaders, the giving side of the gift relationship could be matched to leader-level resources such as Archigos (Goemans et al., 2009) and LEAD (Ellis et al., 2015): the match is done once, at the level of a few hundred heads of state, and the QID then carries it to every gift. Donor and ideology data such as DIME (Bonica, 2014) could be crosswalked the same way for American recipients. For countries, the ISO codes stored on Wikidata country items connect the country-year panel to standard cross-national data through existing converters (Arel-Bundock et al., 2018).

9.2 WHY THE KEY MATTERS FOR LIVING DATA

Persistent identifiers also make the link durable. If our data and the CLD both update, the join still works, because neither project's internal row numbers or name spellings matter. By contrast, a crosswalk built between two static files on names breaks as soon as either file is revised. The QID moves the work of maintaining identity out of individual research projects and into a shared, openly edited resource. When a Wikidata editor merges two duplicate items for the same person, every project keyed to that person benefits.

Table 16. Recipients who received gifts under more than one branch, with the sequence of branches and the years in which gifts were received. Fifty-three recipients meet this criterion; the fifteen with the most gifts are shown.

Name	Wikidata	Gifts	Sequence of reporting branches (years received)
Barack Obama	Q76	482	Legislative (2005–2008) → White House (2009–2016)
Hillary Clinton	Q6294	298	White House (1998–2000) → Legislative (2002–2007) → Diplomatic (2009–2013)
Condoleezza Rice	Q47216	246	White House (2001–2004) → Diplomatic (2005–2008)
Joe Biden	Q6279	229	Legislative (2000–2009) → White House (2009–2023)
John Kerry	Q22316	165	Legislative (2001–2012) → Diplomatic (2013–2023)
Bill Clinton	Q1124	151	White House (1998–2000) → Diplomatic (2009–2010)
John Owen Brennan	Q984191	83	White House (2009–2012) → Intelligence (2013–2017)
David Petraeus	Q28591	49	Defense (2009–2010) → Intelligence (2011–2012)
Leon Panetta	Q244631	49	Intelligence (2009–2011) → Defense (2011–2012)
Mike Pompeo	Q473239	47	Intelligence (2017–2018) → Diplomatic (2018–2020)
Antony Blinken	Q7821917	38	Legislative (2002–2009) → White House (2012–2013) → Diplomatic (2015–2023)
Chuck Hagel	Q381670	36	Legislative (2000–2006) → Defense (2012–2015)
William Joseph Burns	Q1276563	36	Diplomatic (2004–2014) → Intelligence (2021–2023)
David S. Cohen	Q20067627	23	Other executive (2010–2012) → Intelligence (2015–2022)
Susan Rice	Q50612	16	Diplomatic (2011) → White House (2013–2015)

10 OFFICE VERSUS OFFICEHOLDER

The study of bureaucracy has long distinguished the office, with its authority, its agenda, and its foreign counterparts, from the person who occupies it, with their ambition, expertise, and networks (Gailmard and Patty, 2007; Lewis, 2008; Teodoro, 2011). Many administrative datasets record only the office. The gift reports record both, and the QID lets us separate them.

Table 16 and Figure 6 show what this looks like. Fifty-three recipients received gifts under more than one branch. Hillary Clinton appears as First Lady (White House, 1998–2000), as a senator (2002–2007), and as Secretary of State (2009–2013). Mike Pompeo moves from the CIA to State; Leon Panetta from the CIA to Defense; David Petraeus from Central Command to the CIA; William Burns from the State Department to the CIA; John Brennan from the White House to the CIA. Antony Blinken appears as a Senate Foreign Relations Committee staffer, as a White House national security official, and as Deputy Secretary and then Secretary of State. The office-level record ("the intelligence community reported 947 gifts") and the person-level record ("Pompeo received 47 gifts, under two branches") answer different questions, and the QID lets a researcher move between them.

The design supports several kinds of analysis:

- **Within-person comparisons across offices.** Does the same individual receive more, or more valuable, gifts after moving to a more senior or more externally facing office? Holding the person fixed isolates the effect of the office.
- **Within-office comparisons across holders.** Do successive holders of the same post (Secretaries of State, CENTCOM commanders) attract similar gift portfolios, or do some holders carry their foreign relationships with them? A giver who presents gifts to the same American across several of that person's posts is evidence of a *personal*, not institutional, tie.

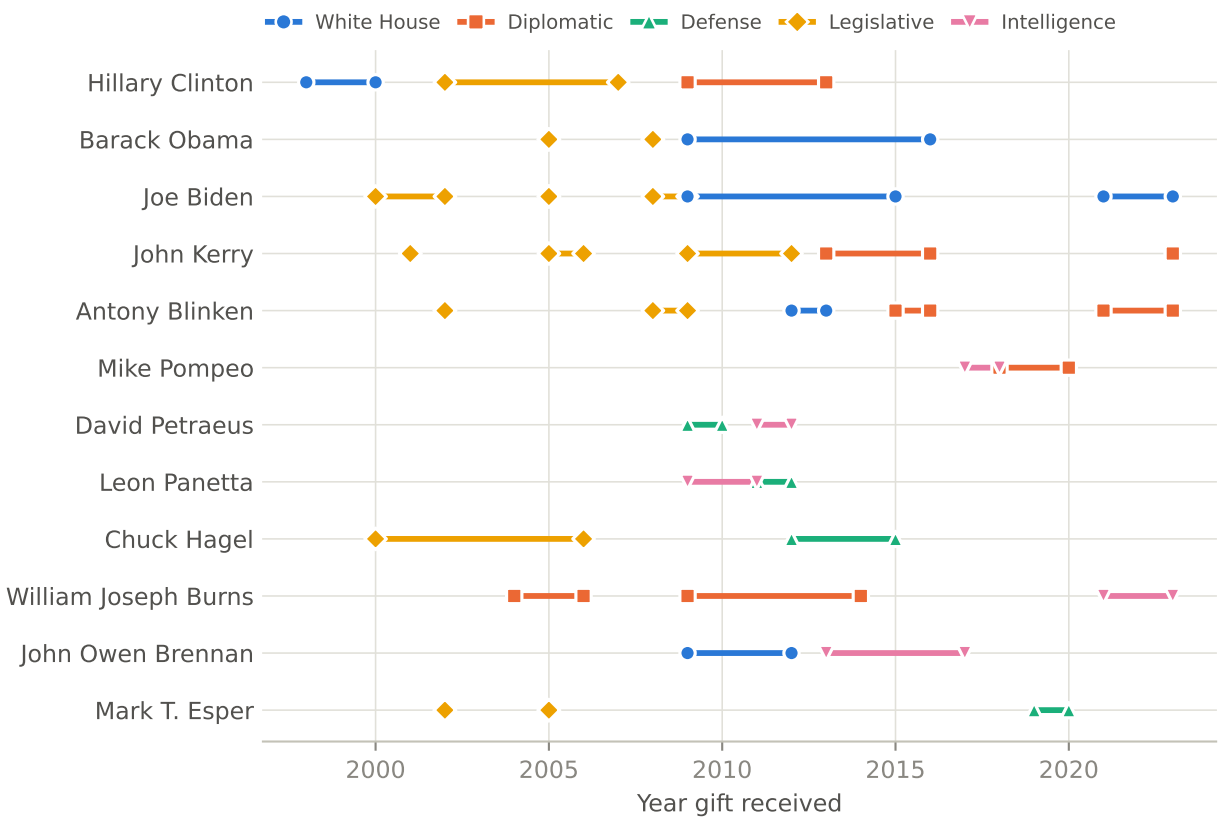

Figure 6. Careers traced through the gift record. Each row is one person (one Wikidata QID). Segments span consecutive years in which that person received gifts reported by a given branch; gaps of more than two years break a segment. Colors and marker shapes both identify the branch.

- **Revolving doors and career paths.** Movements between Congress, the executive, and the intelligence community, and on to the private sector, are central to research on capture and influence (Dal Bó, 2006; Blanes i Vidal et al., 2012). The gift record observes the public-sector legs of these paths with exact dates.

10.1 WIKIDATA UPDATES WHAT THE GIFT RECORD CANNOT

The gift record observes a person only while they hold an office that receives foreign gifts. Wikidata observes the whole career and keeps observing it. Liz Cheney appears in our data in 2005 as a Principal Deputy Assistant Secretary of State and in 2008 as "Vice President's daughter." Her later service in the House of Representatives (2017–2023) is absent from the gift reports but is recorded in Wikidata, with start and end dates, and arrives automatically through her QID. Mike Pompeo enters the gift record as CIA director, but Wikidata supplies the four House terms before it. For a living dataset this is the key property. Because enrichment is re-run at every release, a recipient who later becomes an ambassador, a legislator, a lobbyist, or a convicted official acquires that attribute without anyone revisiting the gift data. The query that refreshes positions for any set of people is short:

Listing 2. Positions held, with dates, for a set of recipients (SPARQL, Wikidata Query Service).

```
SELECT ?person ?personLabel ?positionLabel ?start ?end WHERE {
  VALUES ?person { wd:Q6294 wd:Q473239 wd:Q5362573 }   # Clinton, Pompeo, Liz Cheney
  ?person p:P39 ?st . ?st ps:P39 ?position .
  OPTIONAL { ?st pq:P580 ?start }  OPTIONAL { ?st pq:P582 ?end }
  SERVICE wikibase:label { bd:serviceParam wikibase:language "en". }
} ORDER BY ?person ?start
```

The same mechanism works on the giver side. Abdullah of Saudi Arabia appears in our data first as Crown Prince and First Deputy Prime Minister and later as King. Rather than re-coding each giver's title by hand, a researcher can read the giver's office at the date of the gift from Wikidata's dated P39 statements.

11 AUTOMATIC TRACKING OF DIPLOMATIC CONTACT

A gift requires a meeting, or at least the delivery of a personal token from one official to another. Gift records therefore proxy *personal diplomatic contact*, and because each gift carries a receipt date, the proxy is timed to the day. This complements existing measures of diplomatic ties, which typically record embassies (Kinne, 2014) or leader visits (Lebovic and Saunders, 2016; Malis and Smith, 2021; Goldsmith et al., 2021). Gift records reach further down the hierarchy than those measures do, to commanders, deputy secretaries, and congressional staff, and they record who met whom.

The pipeline produces this measure automatically. Each release writes a balanced country-year panel (169 countries $\times$ 25 years = 4,225 rows) with the number of gifts, total value, and number of distinct American recipients. Only 43% of country-years record any gift, so the indicator varies a great deal both across countries and within them over time. Because the panel is keyed by ISO code, it merges directly with standard country-year data. Because it is regenerated with each release, a new year of contact appears without additional coding.

Two features make gift-based tracking especially useful for studies of particular events or relationships.

- **Event alignment.** With receipt dates, gifts can be aligned with independently recorded events: presidential and secretarial trips and foreign leader visits recorded by the State Department's Office of the Historian (Office of the Historian, U.S. Department of State), summits, arms sales, or crises. The match rate between gifts and visits is itself a validation exercise. A visit without a gift, or a gift without a recorded visit, points to an encounter that one source missed.
- **Relevant years for a given actor.** For any person or country, the data identify the years in which contact with American officials occurred, and with whom. A researcher interested in, for example, Qatari engagement with the U.S. military can find the relevant years and counterparts directly, rather than combing through news archives.

12 APPLICATIONS

The finished data project supports research across several subfields.

Diplomacy and alliance politics. Gift flows provide a person-level measure of the intensity and seniority of bilateral contact. Researchers can ask whether contact intensifies before arms sales, basing agreements, or votes in international organizations; whether it shifts with changes of government in Washington or abroad; and whether some states cultivate the military rather than civilian leaders (Figure 3).

Influence, emoluments, and accountability. Gifts are the most literal form of foreign influence over officials, and gift exchange has deep roots as a mechanism of obligation (Mauss, 1990). The data allow systematic study of who receives the most valuable gifts, whether value tracks policy salience, and how dispositions (retained for official display, transferred to the National Archives, purchased by the recipient) vary across agencies. Linked to lobbying and post-government employment data through QIDs, they connect foreign gift-giving to later career outcomes.

Legislative studies. Through the CLD and Wikidata positions, gifts to members of Congress can be connected to committee assignments, seniority, and electoral histories. Congressional travel gifts (41% of congressional gifts) provide a measure of foreign-funded delegation travel that can be compared with legislators' committee portfolios, in the spirit of research on informational lobbying (Hall and Deardorff, 2006). On the giver side, foreign legislators identified through the CLD give a view of parliamentary diplomacy.

Bureaucratic politics and careers. The office/officeholder design supports studies of political appointees versus career officials (Lewis, 2008), of how ambition shapes behavior (Teodoro, 2011), and of how foreign relationships accompany officials across posts. The recipient profiles (Table 7) let researchers ask whether foreign governments direct more, or more valuable, gifts to appointees than to career officials, to officers than to civilians, or to officials with foreign education. The dyadic comparisons (Table 8) can be modeled directly: with the branch-year baseline as a null, a researcher can estimate whether shared careers, cohorts, or schooling predict repeated gifts or gifts that follow an official from one post to the next. Because Wikidata keeps updating positions, the post-government careers of recipients accumulate automatically.

Gender and the politics of the spouse. First ladies are among the largest recipients by value (Michelle Obama's 154 gifts total $1.8 million), and the data distinguish gifts given to officials in their own right from gifts given to spouses and family. Combined with Wikidata's gender and family statements, the data speak to research on gendered roles in political life (Teele et al., 2018).

Networks. Each release writes a person-to-person edge list (4,195 giver–recipient pairs with counts, values, and first and last years) suitable for network analysis (Hafner-Burton et al., 2009; Ward et al., 2011). Centrality measures identify the American officials who serve as hubs of foreign contact and the foreign officials who reach across many U.S. institutions. Bipartite projections reveal which American offices share foreign counterparts.

A template for other registers. Many governments publish gift, hospitality, and interest registers for ministers and legislators, in formats as loose as the American one. The pipeline's architecture, in which lookups are stored as data, entities are keyed by QID, and every step is rebuilt from source, transfers directly. Wikidata-keyed registers from several countries would support the first comparative study of official gift-giving.

12.1 THE INTERACTIVE APPLICATION

We are building a Streamlit application on top of the pipeline outputs. It will have two primary views. A *network view* draws the person-level edge list, filterable by year, branch, giver type, and country, with nodes linked to their Wikidata pages. A *map view* renders the country-year panel as a world choropleth with a year slider (a prototype is generated as `analysis/output/map_gifts_by_country.html`). Because the application reads only pipeline outputs, it updates when the pipeline does: a new annual report reaches the application without any change to the application code.

13 LIMITATIONS AND VALIDATION

Several limitations bound what the data can show.

Reporting is not giving. The data record gifts that were *reported*, above a threshold that rose from year to year. Compliance varies across agencies and over time, and an Inspector General review found weak controls over the custody of reported gifts (GSA Office of Inspector General, 2024). Changes in volume, such as the post-2016 decline, may reflect reporting as much as behavior. Values are nominal and are the agencies' own estimates.

Withheld identities. Nine percent of all gifts, and 99% of intelligence gifts, withhold the giver. These records support analysis at the level of the institution, not the person.

Parsing and coding error. Free-text parsing is imperfect, and the giver-type and country codes are heuristic. We report agreement between the two country sources (99%) as one check. Researchers should consult the original `item_orig` text, retained in every release, for any record central to an argument.

Wikidata is edited by the public. Wikidata statements can be wrong, incomplete, or vandalized, and coverage is better for prominent people and for some countries than others. Two practices mitigate this. First, each release should snapshot the statements it uses, with a retrieval date, so results are reproducible even as Wikidata changes. Second, identity links rest on human verification, not on automated matching. The living design also exposes errors that a static release would bury. In preparing this paper, consistency checks revealed that several hard-coded officeholder identifiers pointed to unrelated Wikidata items, and that duplicate keys in a lookup table were silently duplicating about 3% of gift rows. Both were fixed at the source, and every derived file was corrected by a single rebuild.

Report year versus receipt year. Backlogged filings mean the report year can lag the receipt year. We provide both and recommend the receipt year for analyses of timing.

SUMMARY POINTS

1. The annual U.S. foreign gift reports are an official, person-level record of contact between foreign governments and American officials. The current release covers 10,428 gifts from 169 countries, 1999–2023.
2. A living dataset is rebuilt from source by code at each release and stores human judgments as versioned lookup data. This removes the main costs of static data: difficult updates and lost cleaning decisions.
3. Resolving givers and recipients to Wikidata identifiers turns merging into an exact join. Two hundred forty-seven recipients and 179 givers can be joined to the Comparative Legislators Database with no name matching.
4. Wikidata statements reached through the QIDs profile the officials who receive gifts. Recipients differ sharply by branch in military service, diplomatic careers, gender, and party membership.
5. Givers and recipients resemble each other more than random pairings would, but most of the resemblance is institutional: each office draws a characteristic foreign counterpart. Person-level similarity in career and cohort is modest, and shared schooling at American universities and military colleges is rare but above chance in the executive agencies.
6. Classified by career, technocrats, business people, military officers, and spouses tend to exchange gifts with counterparts of the same background, but sorting by office is much sharper. Background shapes the form of gifts more than their value once branch and year are held fixed.
7. The identifier separates office from officeholder. Fifty-three officials appear under more than one branch, which allows within-person comparisons across offices.
8. Wikidata enrichment is re-run at every release, so career information that the gift record cannot contain, such as later offices, accumulates automatically.
9. Gift records provide an automatically updated, date-stamped proxy for personal diplomatic contact that reaches below the head-of-state level, and the pipeline writes it as a balanced country-year panel.

FUTURE ISSUES

1. How well do gift records track independently recorded diplomatic contact? Systematic validation against the Office of the Historian's travel and visit records is the next step.
2. Do shared characteristics between givers and recipients predict sustained relationships, such as repeated gifts or gifts that follow an official across posts? Do foreign alumni of American universities and military colleges direct gifts toward fellow alumni?

3. Can gift reporting itself be modeled, separating changes in giving from changes in compliance, especially across agencies and administrations?
4. What standards (snapshots, provenance fields, change logs) should political scientists adopt when their data depend on an externally edited knowledge base?
5. Can the pipeline be generalized to gift and interest registers in other countries, enabling comparative research on official gift-giving?
6. How should credit and citation work for a dataset that changes every year and whose identity layer is maintained by a community outside the discipline?
